

PHASE II

Coding Compliance and Object-Oriented Implementation

Wayne State University • Computer Science • CSC 4110

Course	CSC 4110 - Software Engineering	Phase	Phase II
Topic	Coding Compliance	Focus	OOP design, artifacts, and documentation

Purpose. In this phase, your team will transform analysis work from Phase I into a documented object-oriented implementation that demonstrates sound software engineering practices, appropriate architecture, and traceable project artifacts.

Assignment Overview

Deliverable expectation: Present a professional software engineering package with organized code, documentation, and supporting artifacts that are internally consistent and easy to evaluate. **Create a document that summarizes where everything is.**

Required Tasks

Step	Requirement
Step One	Create classes using the Identifying Analysis Classes method.
Step Two	Code your classes to demonstrate abstraction, inheritance, polymorphism, and encapsulation. Include meaningful comments where appropriate.
Step Three	Ensure the implementation follows SOLID design principles and remains aligned to the SRS.
Step Four	Ensure the solution follows any architectural pattern specified in Phase I or the project requirements.

Continuation from Phase I

Carry forward and organize the following artifacts from Phase I. Your submission should present these items in a coherent structure such as folders, a landing page, or a traceable deliverable index.

	Required artifact or discussion item
☐	Document control
☐	Create an HTML landing page for all project artifacts
☐	Vision
☐	Mission
☐	Idea generation / declaration
☐	Defined feature set
☐	Stakeholder identification
☐	Requirements database assignment
☐	Inception requirements
☐	Elicitation requirements

☐	Elaboration / non-functional requirements
☐	User stories and action diagrams
☐	Established metrics
☐	Testing
☐	Use case diagram
☐	User guide
☐	Discussion of stakeholder needs, specifications, and how the team
☐	Explanation of how the final vision responded to stakeholder requirements

Stakeholder Response Requirement

Required written discussion: Discuss stakeholder needs and specifications, explain how your team identified those needs, and describe how the final vision and implementation satisfied stakeholder requirements.

Phase III Look-Ahead

Prepare a concise summary explaining how your output satisfied each of the following evaluation areas: features, software design, unit testing, code reviews, coding convention, bug management, documentation, product backlog, sprint planning, collaboration, and Scrum meetings.

Submission Quality Expectations

Organization: Deliverables are labeled, ordered, and easy to navigate.

Technical quality: Code demonstrates required OOP concepts and aligns with the SRS and architecture.

Documentation: Artifacts clearly explain decisions, requirements, testing, and stakeholder response.

Professionalism: Submission is polished, consistent, and suitable for an upper-level software engineering course.
